**Individual escape maps for each serum in the 2010-2011 cohort, analyzed against the A/Perth/16/2009 library.** Line plots show summed escape scores of each sampled mutation at that site. Logo plots show mutation-level escape at key sites, where the height of each letter corresponds to the escape score for that amino acid substitution. (A) Child sera, (B) adult sera. Escape scores for singly-infected ferrets shown in **Figure 4** are data from the postinfection ferret samples originally published in Figure 6 of Lee et al. (2019).
